The Viasat Radio Frequency Generator 1000 (VRG-1000) is the only AIMS certified, true-to-life environment generator for testing Identification, Friend or Foe (IFF) systems in high-density signal environments. With an industry leading 50 independent interactive IFF interrogator or 25 independent interactive transponder platforms, this test set brings high-density signal testing on-location to your installed or in-development IFF system, so you can replicate crowded airspace and reduce flight test time by evaluating your system in a lab.

**ONLY AIMS CERTIFIED IFF ENVIRONMENT GENERATION TEST SET**

This portable RF environment generator includes an intuitive graphical interface that works with a standard web-based browser, no additional software needed. The operator can create and control a test scenario that includes moving platforms, each with an IFF interrogator or transponder. Each IFF interrogator and transponder can be associated with an antenna pattern to create a dense, robust, and realistic IFF environment. The System Under Test (SUT) is presented with interactive IFF replies that have the correct relative time delay and amplitude, so they can be received and analyzed as they would in dynamic operation. For advanced antenna testing, a sum and difference channel configuration (VRG-1000SD) is available upon request.

With an established library of IFF signals, independent control of all transponders and interrogators, and a convenient compact design, Viasat’s VRG-1000 delivers easy and accurate IFF signal testing to your system.
